

Protect the Heart of Your Business.

These days, the data center is the heart of a company's operations. Like most companies, you want to be proactive about aligning your data center strategy with your business strategy. By getting a Data Center Health Checkup on your current data center, you can arm your IT and facilities departments with the information they need to successfully support your business for the long term.

A Data Center Health Checkup delivers key information to your IT and facilities teams so they can ensure optimal uptime in the data center; information like criticality rating, capacity analysis, thermal and air flow mapping, process evaluation and forecasting. With the fast pace of technology changing within the data center, new demands are placed on power and cooling. Our data center team understands these challenges, determines the risks to your data center, and provides recommendations on tactical fixes. You can extend your existing data center capabilities so your company can delay major renovations or construction and focus on smart growth.

Armed with health checkup information you can better manage your growth and make more strategic decisions about your technology. It will mean you never have to lose business due to constraints like limited space, power outages or overheating.

Benefits

- You get better information for budgeting, planning and forecasting; leading to more strategic, cost-effective decisions.
- We deliver results and recommendations translating to executable steps to ensure a more reliable data center.
- We arm your IT department by providing them clearly defined next steps, giving them the data needed to make sound, strategic, money-saving decisions.
- Getting a "snapshot in time" of your data center—including space, power, cooling, risk, policy and procedure, and thermal and airflow analysis—allows you to be proactive in your mission critical facility planning.
